

Missing Data per Subject

Missing data is non-randomly distributed. For every subject there are two observations with missing conc values. The first missing conc value occurs with an individual's first observation. The second missing conc value occurs after the end of the compound's injection.

Frequency of locations of missing data in conc column

Missing conc data is either located at subject_row_index 1 or at post_amt_index 1. The other locations with missing conc observations in the data. This means that concentration is missing at the moment of when the injection started (subject_row_index==1), and the observation after the injection ended (post_amt_index==1). Locations with no missing data are not displayed.
